

◆ J.A.R.V.I.S. — Starter Kit

GETTING STARTED GUIDE

Build your own conversational AI assistant — voice, a holographic interface, and your choice of AI brain.

01 Welcome

Thanks for getting the Starter Kit. This is a **build-it-yourself** starting point — a working conversational J.A.R.V.I.S. with a holographic interface that you can run, talk to, and customize. It's not a finished or turnkey AI; it's the foundation and the UI, ready for you to make your own.

02 What's included

Conversational JARVIS

Talk or type — natural back-and-forth.

Holographic interface

A standby lock screen + reactive HUD.

Browser voice

Speaks with Windows voices; hears you via the browser mic.

Your choice of brain

Claude, OpenAI, or any OpenAI-compatible model (OpenRouter, Groq, local).

03 What you need

- A **Windows PC** — no GPU required.
- **Google Chrome** or **Microsoft Edge** (used for the microphone and voice).
- An **API key** from your chosen provider:
 - Claude — console.anthropic.com/settings/keys
 - OpenAI — platform.openai.com/api-keys
 - OpenRouter (one key, many models) — openrouter.ai/keys
- **Python** is installed **automatically** on first run (no admin needed) if you don't already have it.

04 Setup & first run

Before you start: after downloading, right-click the ZIP → **Properties** → tick **Unblock** → **Apply**, then extract. This tells Windows you trust the files, so it won't show a "publisher cannot be verified" warning when you run them. (If you do see that warning, it's harmless — click **More info** → **Run anyway**.)

- 1 Unzip the kit to a folder.
- 2 Double-click `start.bat`. The first run installs Python (if needed) plus a few small dependencies, then opens your browser to J.A.R.V.I.S.
- 3 On the first screen, choose your **provider + model**, paste your **API key**, and click **Connect**.
- 4 When the browser asks, click **Allow** for the microphone.

05 Using J.A.R.V.I.S.

- He boots in **standby**. Talk to him, or press the **C** key to open a text chat and type.
- Try: "what can you do?", "tell me a fact about Mars", "give me an idea for dinner".
- Leave the black command window open while you use him — closing it shuts him down.

06 Troubleshooting

"Publisher cannot be verified" — normal for downloaded scripts. Unblock the ZIP first (see Setup), or click **More info** → **Run anyway**.

The mic doesn't work — allow microphone permission in Chrome/Edge, and make sure you opened him in one of those browsers.

"Key was rejected" — recheck the key and that the account has credit/billing enabled.

He hears himself — use headphones, or lower your speaker volume.
